WEB DEVELOPMENT ASSIGNMENT : 15

CSS Grid Advanced Assignment Questions with Hint

---

1. Create a grid container and arrange multiple grid items inside it

Create a container and place at least six items inside it using CSS Grid. Items should align properly in rows and columns.
Hint: Use display grid in container and define grid-template-columns.

---

2. Design a layout using custom column and row sizes

Create a grid layout where first column is small, second is medium and third is large. Also define custom row heights.
Hint: Use grid-template-columns and grid-template-rows with fr and pixel values.

---

3. Create a layout where one grid item spans multiple rows and columns

Design a layout where one main item takes larger space and other items take smaller space.
Hint: Use grid-column span and grid-row span.

---

4. Create webpage layout using grid areas

Create full page layout with header, sidebar, main content and footer using grid-template-areas.
Hint: Name areas properly and assign them to grid items.

---

5. Create responsive grid layout using media queries

Create layout where grid column count changes based on screen size.
Hint: Change grid-template-columns inside media queries.

---

6. Create responsive card layout using auto-fit and minmax

Create card layout where cards automatically adjust based on screen width.
Hint: Use repeat auto-fit minmax combination.

---

7. Create image gallery using CSS Grid

Design image gallery where images are arranged properly and maintain equal spacing.
Hint: Use gap property and repeat columns.

8. Create dashboard layout using CSS Grid

Create dashboard UI with header, sidebar, main content and footer. Sidebar should have fixed width.
Hint: Combine fixed pixel width and fr unit.

9. Create nested grid layout

Create grid layout inside another grid item to manage inner content structure.
Hint: Apply display grid on child container.

10. Create overlapping grid items design

Create layout where one item overlaps another item partially.
Hint: Place both items in same grid position and control stacking.

11. Create asymmetric grid layout

Create layout where column sizes are not equal.
Hint: Use different fr values.

12. Create responsive product grid page

Create product listing layout where number of columns changes automatically based on screen size.
Hint: Use minmax and auto-fit for automatic responsiveness.

13. Compare same layout using Grid and Flexbox

Create same UI layout using CSS Grid and then recreate using Flexbox.
Hint: Understand two dimensional vs one dimensional layout.

14. Create full screen layout using CSS Grid

Create layout that takes full viewport height and distributes content properly.
Hint: Use height 100vh and grid row structure.

15. Create blog layout using CSS Grid

Create blog page with sidebar and main article section. On mobile it should convert to single column layout.
Hint: Change grid structure using media queries.
