WEB DEVELOPMENT ASSIGNMENT : 14

CSS Grid Assignment Questions with Hint and Detail

1. Create a three column responsive layout using CSS Grid

Create a grid layout that shows three columns on large screens, two columns on tablet screens, and one column on mobile screens. Use media queries with CSS Grid.
Hint: Use grid-template-columns with fr units and change column count using media queries.

---

2. Design a complete webpage layout using grid areas

Create a webpage layout that includes header at top, sidebar on left, main content area in center, and footer at bottom using grid-template-areas.
Hint: First design layout on paper and then define grid-template-areas in container.

---

3. Create a dynamic card layout using auto-fit and minmax

Create a card layout where number of cards per row changes automatically based on screen width. Cards should never go below minimum width.
Hint: Use repeat with auto-fit and minmax function.

---

4. Create a product listing page using CSS Grid

Design a product listing section where product cards are arranged in grid form. Each card should contain image, title, price and button. Layout should be responsive.
Hint: Use grid gap and responsive column layout using fr or minmax.

---

5. Create dashboard layout using CSS Grid with fixed sidebar

Create a dashboard layout where sidebar width is fixed and main content takes remaining space. Add header and footer also.
Hint: Use grid-template-columns with fixed pixel and fr unit combination.

---

6. Create image gallery using CSS Grid with equal spacing

Create an image gallery where images are placed in grid with equal spacing between rows and columns.
Hint: Use gap property and repeat function.

7. Create grid layout where one item spans multiple columns

Create layout where one featured item takes two or three columns space while other items take normal space.
Hint: Use grid-column start and end or span keyword.

8. Create nested grid layout

Create main grid layout and inside one grid item create another grid layout for internal content arrangement.
Hint: Make inner container display grid separately.

9. Create asymmetric layout using different column sizes

Create layout where first column is small, second column is medium and third column is large.
Hint: Use different fr unit values like 1fr 2fr 3fr.

10. Create overlapping grid items layout

Create layout where one grid item partially overlaps another item.
Hint: Place items on same grid lines and control using z-index if needed.

11. Create masonry style card layout

Create card layout where cards have different heights but still arranged properly like social media feed.
Hint: Try grid-auto-rows and manual row span.

12. Create responsive blog layout using CSS Grid

Create blog page layout with sidebar and blog posts section which becomes single column on small screens.
Hint: Use media queries and change grid structure.

13. Create grid layout using named lines

Create grid using named grid lines and place items using those names.
Hint: Define names inside square brackets in grid-template-columns.

---

14. Create full screen grid layout

Create layout that takes full screen height and width and distributes sections properly.
Hint: Use height 100vh and grid row distribution.

---

15. Recreate Flexbox layout using CSS Grid

Create same layout using Flexbox first and then recreate same using CSS Grid.
Hint: Focus on difference between one dimensional and two dimensional layout control.
